

Putting your data on the cloud has a lot of benefits like reducing costs, it's easier to use, and it increases storage capacity and automation. As you move more and more data to the cloud, it's essential to identify what kind of data is on the cloud, what needs to be protected, and whether it needs to be compliant with existing regulations.

## What is Covered

- **Interview:** Understand the client's current cloud strategy and cloud deployment
- **Inventory:** Create a comprehensive landscape of all the sensitive data contained in the databases and files using C2 Discover
- **Results:** Perform an analysis on the inventory and identify potential cost-saving, optimizations, risk areas actions in a report

## Benefits

- Proactive instead of reactive: once the data has been identified, you can take steps to secure those data sources
- Gain an understanding of what you have and the next steps
- Limit who has access to what: you can now protect your data even more by giving access to certain databases to the necessary people
